Trade Forecasts

European hardwood consumption rising

L urope's long term decline in sawn hardwood markets is at an end. In 1998 sawn hardwood consumption rose for the second consecutive year. This is the verdict of the UN/ECE annual wood market review issued for the Timber Committee meeting held

in Geneva 27-30 September. The Committee forecast continuing growth in the European hardwood market to at least the end of 2000.

During 1998, apparent consumption of sawn hardwood reached 17.5 million m3. Although European exports increased by 10%, these were compensated for by an increase in imports of 12%. European exports and imports were both at record levels. European production also increased, by just over 3% to 13 million m3. Significant increases in sawn hardwood consumption were recorded in Germany (+12.5%), France (+5.8%), Italy (+6.7%), Portugal (+4.9%), and Turkey (+14.5%). Conditions in the UK have been less favourable, the report indicating a 15% decline in consumption.

During 1998, consumption in North America moved up strongly, by 6.6%. Production was at record levels of 33 million m3. Imports were also significantly up, a reflection of firm US demand and the low prices on offer for Asian woods during 1998. Tropical imports into the United States made particular headway in 1998, The weakness of Asian markets and strength of the US dollar contributed to a 5.3% drop in North American exports.

Russia is the lame man of global wood markets. Consumption during 1998 reached only 3.4 million m3, only one third of levels prevailing in 1992. Russian hardwood demand was hit by the country's economic crises of mid 1998. Russian hardwood production fell by nearly 10% last year, and trade remains stagnant at low levels.

By contrast some Eastern European countries saw significant increases in sawn hardwood production last year, although generally from a small base. For example production in Slovakia increased by 150% to 420,000 m3, production in the Czech Republic increased by 27% to 320,000 m3, and production in Latvia increased 167% to 400,000 m3.

Overall European imports of sawn hardwood rose strongly, by 12%, to a record 8.1 million

^{*} ECE Timber Committee forecasts

ECE Trade cont from page 1

m3. Around 20% of this volume comprised tropical wood. Italy, with only limited domestic forest resources and its large and vibrant wood processing and manufacturing industries, is by far the largest sawn hardwood importer in the whole ECE region. Italy's imports increased 14.8% dring 1998 breaking the 2 million m3 mark. Sawn hardwood imports were high despite stagnation throughout much of Italy's construction industry. While new building has been limited in Italy, renovation activity has been strong. Increased sawn imports also reflect moves in Italy to decrease log imports and relocate primary processing to supply countries.

Forecasts for 1999 and 2000

The Committee forecast that European sawn hardwood consumption would rise by 0.5% in 1999, and then grow by a further 1% in 2000. The forecast reflected growing confidence in the performance of the European economy. Increasing demand would be partly stimulated by improved consumption in the furniture sector. The trend towards the supply of hardwood dimension stock is expected to increase in this sector. There is also expected to be an increasing trend from rough dimension to semi finished products and components. Demand for hardwood flooring is identified as another

significant area of market growth. The Committee suggested that loss of market share due to environmental concerns has partly abated. Less positive for European wood importers, is the prediction that much of the increased demand should be met from increased domestic production. Imports of tropical logs and sawnwood into Europe are forecast to remain flat during 1999. Many tropical producers will benefit from the effects of currency devaluation. On the other hand, these gains will be offset by increasing supply constraints in the tropics, recent moves to restrict tropical log exports by certain producer countries, and continuing efforts to shift towards value added exports. The trend towards substitution of solid wood by MDF and other engineered wood products is expected to continue.

North American sawn hardwood production and consumption, which have been running at record levels in recent years, are forecast to level off in 1999 and 2000. However trade volumes are expected to increase significantly during 1999. Exports are expected to move up 10%, as demand in both Asia and Europe picks up and the dollar's excessive strength in relation to the yen and euro subsides. US hardwood imports are forecast to rise 6% in 1999 due to continuing tight domestic hardwood supplies and strong demand in the US.

IMF links forest reform to Cambodian loan

The IMF has approved a three-year, US\$81.6 standby credit for Cambodia. The "enhanced structural adjustment facility" will be connected to a 1999-2002 program which aims to protect macroeconomic stability, rebuild the Cambodian economy and reduce poverty. There will be seven disbursements of US\$11.7 million each. Installments will be made available subject to Cambodia's performance in implementing reform. Cambodia will need to step up efforts to strengthen revenue in support of increased government expenditure; reduce unproductive spending; and strengthen

public resource management, particularly in forestry. Effectively managing forestry resources is among the most difficult challenges facing the Cambodian authorities. However the IMF note that "measures taken so far have demonstrated the government's commitment to redress past mistakes and move toward an environmentally sustainable policy." On 20 October, the leaders of Cambodia, Vietnam, and Laos at an informal meeting agreed to co-operate in the implementation of forest and environmental policy.

New investment in Guyana

Barama, a Malaysian-Korean partnership involved in Guyana's forestry industry, is investing US\$32m in a wood processing complex to increase production in the country. The venture will take Barama's existing and planned investments in Guyana to US\$132m. The complex includes a sawmill, kiln dryers, a marine slip-way, wharf facilities, houses and a 100 km road linking it to the company's concession in north-west Guyana. A railway line is also planned. The saw-mill will be capable of processing 1,000 m3 of sawn lumber a month and a veneer plant will have a capacity of 2,400 m3 a month from 16,000 m3 of logs. Barama has a 4m acre logging concession in Guyana, and also manufacturers plywood. It exports to the US and Europe.

Guyana's forest land covers about 75% of the country's total 83,000 sq miles. Output from Guyana's forestry industry between January and June reached 231,537 m3, 3% higher than the corresponding period of last year.

EC aid for tropical forests

The European Commission (EC) and UNDP's Sustainable Energy and Environment Division (SEED) have launched a joint initiative to strengthen sustainable forestry management and to support sustainable-livelihood programs in Cameroon, Guyana, and Malawi. The EC will commit US\$2.06 million to the effort, which will be administered through UNDP's Programme on Forests (PROFOR). Activities under the initiative should begin shortly. In Cameroon, the program will strengthen national capacities in sustainable forest management and create an information exchange forum on forestry issues (the Intersectional Consultative Forum on Forests). In Guyana, the program will work through public and private sector partnerships to design practical strategies for sustainable forestry. In Malawi, the money will be used to develop innovative finance mechanisms, build capacity, and support forest planning.

INDICATIVE PRICES

Latest indicative prices available at time when preparing this report. All prices include agent's commission. Prices are subject to continuous variation and may vary in relation to volumes purchased, specification, port of shipment and quality of a particular shippers production. Specifications are given as a guide - in practice the details vary.

Hardwood Market Highlights

- Meranti prices flattened out....
- ...but supplies very tight
- Sapele supplies fully booked
- Cameroon log ban sticks
- US stocks low for time of year
- European hardwood prices firm
- UK trade busy in October

Asian Hardwoods Sellers' market

The rainy season has arrived on schedule in many parts of the Far East, hampering logging in certain areas. Far Eastern shippers have spent much of October handling the large back log of orders that built up when supplies were tight earlier in the season. Prices for Meranti sawn wood from Peninsular Malaysia and Seraya from Sabah have flattened out for the time being. However supplies remain scarce and are expected to get tighter as the rainy season proceeds and the Far Eastern vacation period looms. With redwood supplies tight troughout the tropics, Malaysian producers find themselves in a dominant position. They are able to allocate the limited supplies available to the markets most willing to pay higher prices. Malaysian shippers report that they are seeking to renegotiate contracts at higher prices and that an increasing number of European importers are willing to compromise.

Availability to the UK market has been curtailed, as many producers can obtain better prices by selling 3" by 5" pin hole no defect grade to the Dutch. One factor that has particularly tightened supplies from Malaysia this year has been increased restrictions on logging at higher altitudes, leading to reduced availability of the denser woods that are popular in Holland.

Suppliers in both Peninsular Malaysia and Sabah report firm European demand for their products. In the UK, agents representing Peninsular Malaysia shippers reported a flurry of Meranti buying activity during early October as importers moved to cover themselves for the January/February period. However, by the end of October, buying activity seems to have slowed. Demand for Keruing in the UK has been more patchy as importers are well bought in the species. French importers report that they are having difficulty sourcing Kapur and Bangkirai. To overcome supply constraints and satisfy growing demand, shippers in Peninsular Malaysia have been importing green Meranti lumber from the Indonesian island of Sumatra for kilning and shipment to Europe.

Asian log prices continue firm due to tight supplies, and continuing bouyant demand in China. Demand elsewhere has been patchy.

The log market in Japan has been drifting lower during October due to a slump in plywood sales there. The rising value of the yen has added to uncertainty in Japan's manufacturing sector. Plywood mills are demanding price reductions

Asian Hardwoods Cont.

for logs, but negotiations with bullish shippers are difficult.

A similar situation prevails in South Korea. Continuing weak consumption in Korea has meant that Asian shippers determination to push up log export prices has met with staunch resistance from importers. Sarawak and PNG shippers have been forced to maintain log price levels. Shippers in the Solomon Islands, encouraged by firm Chinese demand, signalled an intention to increase prices. Many Korean buyers gave up contracts for Solomon Is. logs in favour of PNG and African suppliers.

Korean imports of sawnwood have been hit by weak demand. Imports in August fell to 65,386 m3, down 12% on the previous month due to slow demand from construction companies.

ITTO's Market News Service reports on proposals in Indonesia to introduce a levy of US\$2/m3 on round logs. The fund generated from the levy would support human resource development in the forestry sector. The Indonesian Forestry Community has objected to the scale of the charge and has suggested it should be denominated in local currency at between Rp5,000/m3 and Rp10,000/m3.

No more mahogany this year

As elsewhere, supplies of many Brazilian hardwoods of interest to export markets are tight. No new supplies of Brazilian mahogany are expected to be cut this season. Although there are volumes standing, no-one is paying for extraction and it is too late to start new operations this season. The limited volumes extracted this year went primarily to the United States. One load of around 1000m3 is currently awaiting shipment from Brazil. South American Cedar is more readily available and continues to be purchased by a few UK importers. Volumes however are down on previous years. Formerly treated as a commodity and stocked by a wide range of UK importers, the species is now of interest only to importers supplying niche markets. However the species is selling well into the West Indies and Italy.

France is the leading European importer of Brazilian hardwoods. Imports have focused particularly on Tauari, which can substitute for Asian Meranti timber. French stocks of Brazilian species are currently low. This coupled with supply shortages is putting upward pressure of prices. Some contracts to the French market are now running 4 to 5 months late. The situation is partly due to the on-going financial difficulties of many Brazilian mills, which has led to a wave of closures. *ITTO's Market News Service* reports that ex-

ITTO's Market News Service reports that exports of Brazilian lumber to Asia continue to increase, the limitations being on the supply side rather than in demand.

Economic prospects in Brazil continue to improve. The Economists poll of forecasters suggests that GDP will decline by only 0.2% in 1999 and may grow by 3% in 2000. Interest rates are coming down and the Government has announced a new investment programme. Investments are forecast to reach around US\$1,000 billion, covering infrastructure and industrial development among others. However economic reform to bring down the fiscal deficit remains a major political challenge.

African Hardwoods

Sapele supplies fully booked

As in Asia, the African market is now a seller's market. Demand for most African hardwoods has picked up significantly during October. This, coupled with tightening supplies in response to unusually heavy rains and regulatory constraints in some countries, has led to price rises across the board. Most of tropical Africa's good mills are sold out until March 2000. This is making life difficult for importers, who are hardly in a position to predict demand next month let alone March next year.

Cameroon supplies of Sapele are fully booked to the end of the year. Heavy rains are restricting logging and Sapele prices have inched further upwards, although these remain comparatively low compared to previous years. With supply difficulties in both Asia and South America, there may well be room for further price increases.

Demand in Spain and Portugal, both important Sapele markets, has been relatively quiet during October. Iberian importers, who generally treat Sapele as a commodity, may be in for a shock when they return to the market.

As one agent puts it, wood exports from Ivory Coast are "diminishing rapidly". Supplies of iroko from the country are insufficient to satisfy the main markets for the species in Ireland, North Africa and Saudi Arabia. One agent also comments that good quality iroko is harder to find. Prices remain firm. Dimension stock of Dabema from Ivory Coast is added to our list of indicative prices, reflecting growing interest in this product.

Supplies of nearly all species and grades from Ghana are now restricted. Prices are also rising in response to new higher forest royalties. Ghanaian Utile (French Sipo), a potential substitute for Sapele, is only available in limited quantities at relatively high prices. The limited volume of Khaya that is produced is now destined almost exclusively for the United States. Danta, a general flooring and joinery timber, is being bought in limited quantities in the Far East. Spain has been a buyer of the species, but is showing little interest at current price levels. Volumes of sapele and iroko available from Ghana are now very limited. Where available, prices are variable and generally higher than elsewhere. Edinam stocks are available but there are now few buvers. Wawa has become the mainstay of Ghanaian exports. Demand for the species has picked up over recent months and it is now selling well, particularly into the Far East, South Africa and to a lesser extent the UK. Devaluation of the cedi has assisted Ghanaian exporters over recent months.

The export ban on most Cameroon logs now seems to be sticking. The implementation of the ban has created confusion and it is, perhaps, worth reiterating the background. The Cameroon authorities announced introduction of the ban on 18 June this year. The announcement stated that log exports of 22 commercial species, including Iroko, Sipo, Padauk, Ngollon, Bosse, and Bibolo, are to be banned. Log exports of 11 "First category" species, including Azobe, Framire, Koto and Tali, are to be subject to a high rate of tax. Log exports of the remaining "Second category" species, are to be subject to a lower rate of tax. Exports of logs of sapele and ayous will be allowed subject to "special authorisation" and quota allocated to individual exporting companies. The government annoucement allowed for a transition period whereby all log stocks declared by 30 June 1999 could be exported by a deadline of 30 September 1999. Unfortunately an order issued on 31

August by the Cameroon President created confusion. Many interpreted the order as an extension of the transition period during which logs could still be exported. This however is not the case; the order was only designed to link this year's announcement of a log ban with Cameroon's existing forestry laws (originally introduced in 1994). The order does not reflect any change in government policy.

While Cameroon exports of logs have been curtailed, logs from Congo (Brazzaville) and the Central African Republic are still available through Douala. Log supplies are also available from Gabon and Liberia. The recent announcement of a large investment by a joint Malaysian/Liberian venture in Liberia implies a potentially large increase in log exports from Liberia in future years.

Recent reports indicate that there is little change in the difficult supply situation from the two Congo's, both of which have for long been prey to internal difficulties. There are reports of a few shipments from the Democratic Republic of Congo (Zaire) over recent weeks, but volumes remain restricted.

After a very difficult period in Gabon, the French trade press report that the log supply situation has now stabilised. On 3 August this year, SNBG confirmed a partial liberalisation of their monopoly over okoume and ozigo log exports. Forestry companies are now allowed to sell a proportion of their logs of these species to "non traditional" markets, primarily Asia. SNBG will maintain a monopoly over exports to the traditional markets in Europe, North America and Africa. Of the 150,000 m3 of okoume/ozigo logs produced each month, forestry companies are authorised to sell around 26,000 m3 (17%) to non traditional markets.

French stocks of African logs are reported to be at higher levels than last year. French importers apparently built up tropical log stocks earlier in the year in anticipation of the Cameroon ban.

North American Hardwoods

Exporters optimistic over prospects

This is generally a very busy time of year for US exporters as inventories are being built to cover buying over the winter, kilns are operating at top efficiency to dry wood that is already well air dried, and export sales are at their highest. This year is typical in the sense that export orders are increasing in many areas. More unusual is that stocks of certain hardwood species and grades are low.

Demand from some European markets including Italy, Spain and Portugal is picking up. Germany is still quiet, although the German trade press report increasing interest in Cherry, Hard maple and red alder. UK demand is steady, although still described by agents as "cut throat". The Irish market is quieter.

In the Far East, strong demand from HK/China continues, while Japanese demand is also picking up. Other Asian countries are more quiet. The Mexican (mainly red oak) and Canadian markets are both looking strong. US domestic demand remains bouyant.

On the supply side, there are reports of low availability and high prices for standing wood. Long-term reasons include increasing constraints on Federal forest harvests for environmental reasons and the sheer strength of US domestic demand. In the shorter term, the recent hurricane on the east coast disrupted supplies. North Carolina suffered most from mill closures and transport problems.

US exporters seem optimistic over future prospects. At the recent NHLA Convention, exporters were forecasting increased Far Eastern demand, a trend that should be assisted by the significant weakening of the US dollar against the yen over the last 12 months. This factor is expected to increase problems of supply to European markets.

One notable trend in the United States wood market has been increased penetration by foreign imports. The trend is a response to bouyant US demand, the strength of the dollar, tight domestic hardwood demand, and devalued Far Eastern currencies. The trend is particularly pronounced in the mouldings and furniture component sector. Mouldings of radiata pine are selling very quickly in the United States, while increasing volumes of furniture components, notably of rubberwood and ramin from the East Asia, are also being imported.

UK agents note that, while supplies are getting shorter, it is still possible to obtain most species and grades as long as the price is right. The problems of US supply that are emerging relate particularly to thicker sized lumber. US mills have been reluctant to saw thicker sizes because these take longer to dry and therefore tie up capital. The problem relates particularly to Maple, Beech and Cherry, but also includes Red oak, White oak and Ash.

Looking at individual species, US inventories of ash are low. Sales of all thicknesses are improving. Interest in the species in both Japan and Europe is increasing.

Interest in US beech is increasing due to limited stocks of the European species. However US inventories are also low.

Availability of good quality Hard maple for export is now extremely limited. Some buyers have been looking at lower qualities to make up short falls. Prices are very variable depending on supplier, but are generally very firm. Exports of soft maple are incrasing to the Far east. The species is increasingly being selected for white colour to act as a substitute for beech and hard maple.

Red oak, much in demand in the US, is also attracting steady orders from overseas, with Mexico and Asia picking up noticeably.

Cherry supplies are extremely tight, particularly for the higher grades. Moves to protect the Indiana bat under the Endangered Species Act in the Allegheny National Forest have disrupted USA TEMPERATE HARDWOODS INDICATIVE PRICES (North Appalachian) US\$ CIF UK MBM KD square edged net measure after kilning

Cherry supplies this year. However, efforts are now underway to restart logging in various working areas in the National Forest subject to tight environmental control.

Demand for white oak in both the UK and continental Europe is comparatively slow and highly competitive. Spanish demand has been particularly disappointing. Demand is increasingly for dimension stock of this species.

The major European market for tulipwood in Italy is not as strong as many exporters would have hoped. Demand in Japan has been picking up. Availaibility is tightening.

European Hardwoods Prices well up on last year

Already concluded private sales and auctions indicate price increases of up to 15% for veneering beech log grades over last year. There is intense competition amongst European mills for sawlogs, with prices for better qualities often above the ability of domestic European mills to pay. Prices are being forced up by strong demand in China, and to a lesser extent in Taiwan. As things stand however, it is unlikely that Chinese buyers will go above these prices later in the year. The Chinese market, while big, is suffering from temporary glut as a result of excessive imports during the first half of 1999. Another notable trend is increasing competition from Eastern European suppliers for Chinese markets.

The Autumn hardwood auction sales are well underway in France, with average prices for all species and qualities generally higher than last year. European beech is in strong demand from Chinese buyers who are looking particularly for thicker logs in lighter tints. Demand for oak from French sawmills is extremely firm. Oak sawmills are operating at full capacity. Some mills have log stocks to last until April, but others have relatively low inventories and are looking to restock. Demand for rustic oak is advancing in France, while the stave market for wine barrels remains strong.

Early indications are that beech log prices in Germany are around 5 to 10% higher than last year. German manufacturers are suffering, having difficulty obtaining quality beech and unable to pass higher prices on to their domestic customers. German domestic dermand, notably in the furniture sector is still weak. German sawmills are no longer prepared to supply better quality sawn beech at home, as they are able to obtain better prices overseas. In addition to China, German exporters are finding a ready

market in Spain. Spanish importers are switching to Germany in response to relatively high prices in France.

Western European hardwood producers are coming under competitive pressure from Balkan countries, notably Romania, that are able to supply beech at lower prices. The quality of the wood from Eastern Europe is often high, but supply is restricted by capacity constraints. Much of the processing plant in Eastern Europe is outdated, kilning facilities are restricted, and technical skills may be lacking.

The Forectry Commission reports that UK's small domestic hardwood sector is performing relatively well in 1999. Prospects for construction grade and dimension stock are reasonable. UK domestic oak, beech and sycamore have benefited from the recent fashion towards lighter coloured woods. UK oak prices remain good, and UK exports of best quality veneer and high quality hardwood have been strong in 1999. UK hardwood sawmillers generally buy for known customers and do not hold speculative stock.

UK HARDWOOD IMPORTS

Statistical commentary June 1999 data

Developments on previous month

Tropical log imports declined 36% between May and June 1999, the major decline being from Cameroon. However, tropical sawn imports were up 27%, with increased imports from Malaysia and Ghana. Sawn imports from Brazil declined significantly.

Temperate hardwood log imports were up 35%, with particular gains by Canada, the USA and Estonia. Temperate sawn imports were also up 35% on the previous month, with significant increases in imports from the USA and Canada.

Imports of tropical veneer, notably from Ghana, increased between May and June. Tropical plywood imports were down 16% on the previous month. Imports from Brazil and Indonesia declined, while imports from Malaysia increased.

Developments on previous year

UK imports of tropical logs and sawn are marginally down (-8%) on last year. Imports from Cameroon, Gabon, Brazil, Ghana, and Ivory Coast all registered slight declines. By contrast, Malaysia gained market share. Imports of temperate logs and sawn are down

5% on the previous year. Falling US oak and

Estonian birch imports are noticeable. Imports from Canada increased marginally.

Imports of tropical veneer are down 30% on the previous year, with a major decline of 30% in imports from Zaire. However veneer imports from Ghana increased significantly. Temperate veneer imports have remained flat.

Tropical plywood imports increased 93% over the previous year. Indonesian plywood imports have

more than doubled, while imports from Brazil and Malaysia increased by 68% and 17% respectively. South Korea, Chile and Thailand are all emerging as significant plywood suppliers to the UK. Suppliers in these countries have moved in as strong US demand has led to a 90% drop in US plywood exports to the UK.

Within the EU, Finnish plywood imports have increased significantly.

NOTES

1. Statistics are based on official figures of HM Customs and Excise. We try to amend anomalies, but it is not always possible to identify them. The imports of tropical wood apparently coming from continental Europe may include goods transhipped through a continental port. Boules and forms of square edged stock may be included under 'logs'. Where species are shown as coming from a source where it is known they do not occur, then it is assumed that the wood is wrongly identified and it is classified under "others" for that country. Major inconsistencies between volumes, weights and values are reconciled by estimates based on previous performance.

2. Logs and sawn data for "other" species derived from Estonia (Total cum 1999 volume 33071 m3) and Latvia (total cum 1999 volume 66939 m3) are omited from this table as these volumes are assumed to contain large quantities of softwood.

3. HM Customs and Excise Data for trade within the EU is subject to delay. Because of new methods of statistical collection, returns may remain incomplete. Statistics are recorded as received and may be corrected subsequently and marked "C".

United Kingdom

Active hardwood demand

Traditionally the autumn is a relatively busy period for UK hardwood importers as stocks are built up to cover the holiday season at the end of the year. This year is no exception as hardwood agents variously report demand as "steady" to "very bouyant". Most report heightened activity during early October, although some suggest business tailed off towards the end of the month.

However this year is marked out by difficulties of supply. Reports of unusually tight supplies and higher prices are emanating from all the traditional sources of imported hardwood. Suppliers in the Far East, West Africa, North and South America are all reluctant to take forward orders. Many importers seem to have been caught with low inventories just at a time when underlying demand is picking up and are now struggling to obtain supplies.

Those trading companies able to supply Just-In-Time are reporting record sales and imminent shortages. There is speculation that demand for tropical wood has been boosted as finishing work is carried out on the wide variety of Millennium projects around the country.

Economic indicators in the UK are generally encouraging, although there are signs of weakness. Manufacturing output is rising slowly and unemployment continues to decline. GDP rose by 0.6% in the second quarter and has probably accelerated in the third. Inflation is still under control. The Bank of England voted to keep interest rates unchanged at 5.25% in October, although most economists expect rates to be raised in November. Retail sales rose sharply in September, to the strongest rate of increase since April 1997.

On the down side, the Halifax index of house prices fell unexpectedly by 0.1% in September, reducing the annual rate of increase from 9.4% in August to 8.8% in September. Also the total value of contracts for new construction so far this year shows a year-on-year drop of 6.6%. However new house starts are now improving, rising by 2.8% in the quarter to August compared with the same time last year. The latest report by Verdict Research predicts that, amongst retailers.

The latest report by Verdict Research predicts that, amongst retailers, the DIY and gardening sectors will be 'an oasis of significant growth' in the next 2 years. Both sectors have become fashionable and are no longer dependent solely on activity in the housing market but are benefiting from the concept of improving rather than moving.

Plywood Indonesian instability

October has been characterised by unstable market conditions. The problem stems from Indonesian mills that have reduced prices to very low levels. In early October, Indonesian mills were quoting prices to European importers as low as INDO96 less 25 to 28 for BB/CC grade. Brazilian shippers followed the trend in an effort to maintain market share. At one point in early October, Brazilian plywood prices were dropping 4% per week. Many Malaysian shippers, finding they are unable to compete, have turned their back on the European market. Many Malaysian mills are focusing on the sale of special plywood grades to Japan or the production of veneers. European importers have suffered from the price collapse, having seen the value of existing stocks severely undermined.

Immediate causes of the fall in prices are two fold. An immediately obvious factor has been the loosening up of plywood supply in Indonesia towards the end of the dry season, together with the weakness of the rupiah in the face of political uncertainty. Continuing economic problems within Indonesia and uncertainty surrounding the recent presidential elections led the rupiah to fall to around 8000 against the dollar in early October.

However, the extent of price instability suggests there may be other more fundamental problems at the heart of the Indonesian plywood industry. One factor may be a feeling of insecurity amongst the mill owners themselves. Against a background of political instability, Indonesian plywood owners, many of them Chinese, have been keeping a good proportion of their profits offshore. Many owners are keen to ensure that assets can be quickly removed from the country if they are forced to leave. In the build up to the election, many owners may have been driven by a short term desire to convert stock into dollars. By the end of October signs of a return to sanity were beginning to emerge within the plywood market. The rupiah strengthened 15% in the im-

First certification under US sustainability scheme

Willamette Industries, Inc. has become the first major forest products company to receive independent third-party certification that its forest management practices are in compliance with standards of the American Forest & Paper Association's (AF&PA) Sustainable Forestry Initiative (SFI). Willamette's 610,000 acres of Oregon forest lands were audited in mid-September by PricewaterhouseCoopers. The company will receive an unqualified opinion when the final report is released, meaning that the company's western timberlands are third-party certified as meeting SFI standards.

The SFI verification procedures link rigourous management standards modelled on ISO14001, with detailed forestry performance standards. Participation within SFI is now open to both members and non members of AF&PA.

mediate aftermath of the presidential elections. There also appears to have been a realisation that log stocks are relatively low in the Far East. Supplies will only become tighter with the onset of the rainy season. The Asian holiday season is also less than 2 months away. Indonesian mills are now withdrawing the lowest offers.

Brazilian hardwood ply shippers have struggled to compete with Indonesian prices and exports have been curtailed. However there is still slack in the system, and production could be increased if prices improve over the coming months.

Over recent years, Japan's imports of wood based panels, consisting primarily of plywood, have been declining as domestic production has taken an increasingly large slice of the market. However this year has bucked the trend. The share of imports in the total supply of woodbased panels to Japan during the first half of 1999 reached 53.5%, the first time imports exceeded domestic supply. Japan's domestic production of wood based panels declined by 1.5% to 2.61 million m3 while imports jumped by 25% to 3 million m3. Plywood importers were encouraged by rising house start figures to buy aggressively during the first 6 months of this year. However Japan's plywood market is now oversupplied and demand has weakened. Korea's domestic plywood market weakened again in September and October. Demand from the construction sector remains weak. Korea's domestic plywood industry has particularly suffered. The weakening of the rupiah increased Korean importers interest in Indonesian plywood, while sales of domestic plywood fell dramatically. Stocks have built up and some Korean mills are now considering cutting back on production. Korean plywood imports during August totalled 65,047 m3, around 35% higher than July. Korean plywood production in August was 61,266 m3, 8% down on the previous month.

South African forest privatisation

The long-delayed privatisation of Safcol, the South African forestry company, moved ahead at the end of October with the announcement of a shortlist of five bidders. Safcol's assets include 330,000 hectares of commercial forest and five sawmills and are valued at 1 to 1.5 billion rand. The assets are being sold in five individual packages to break the monopoly of ownership and promote efficiency and competition. Successful bidders include the African Forestry Consortium, a black empowerment company that has teamed up with Sappi, the Johannesburg-based international paper company, and the Siyaqhubeka Consortium, which includes Mondi, the paperproducing arm of the Anglo-American Group. China Prices to rise

According to a report in China Daily, the deputy director of China's State Forestry Bureau's forest products co-ordination centre predicts that timber prices in China will rise 5% to 10% over the next 8 months. His price-hike forecast assumes higher personal incomes and expectations that the State will invest more in wood-buying for infrastructure projects. Price rises for timber imported into China will also be boosted by increased demand for Chinese furniture from recovering Asian economies, and strong demand in the American and European markets. He noted that timber prices in provinces and autonomous regions in South China, such as Guangdong, Fujian and Guangxi, had already begun to pick up.

An article in the Pacific Rim Wood Market Report highlights that reforms to the housing market in China look set to further increase domestic demand. Company supplied housing in China is now a thing of the past. In a 1998 policy change people can now sell homes and have mortgages. The numbers involved are huge. There were 14.2 million new housing starts in 1998, and there are 10 million newly married couples each year. Current housing does not meet the desires of today's population, and there is growing demand for renovation. The export potential in this market is primarily for components that can be assembled in China, generating employment there. There is unlikely to be much demand for all wood housing as most Chinese think these are susceptible to fire, earthquakes and pests. Wood will be used in conjunction with concrete. A major challenge still facing wood use in this market is the need to rewrite national codes and standards.

US producer moves overseas

Boise Cascade, the US pulp and paper group, has been granted permission to build one of the world's largest oriented strand board (OSB) plants in Chile. Permission was granted by Chile's supreme court after a year-long court battle with environmental and industry groups in southern Chile. Boise Cascade and Maderas Condor, its local partner, will spend about US\$160m on the plant, which will be modelled on the US group's first and only OSB plant, in Ontario, Canada. OSB is an increasingly popular alternative to plywood. Environmentalists in the region, which relies heavily on tourism, have objected to the amount of native forest needed to keep the plant operating at full capacity.

Company spokesmen suggest that the supreme court decision has meant that construction can now begin, although financing still has to be worked out. The factory will have minimum capacity of about 400m sq ft of OSB a year, putting it among "the largest in the world". The move reflects diminishing concession areas in US national forests which is forcing US wood companies overseas.

Germany Poor performer

German imports of tropical logs and sawn have been in decline during the 1990s. Tropical log imports fell from over 350,000 m3 in 1989 to only 135,000 m3 in 1997. Tropical log imports increased by 22% last year compared with 1997, but are weakening again this year. Germany sources her logs almost exclusively from West Africa. Problems of log supply from the Cameroon, the Gabon and the two Congo's has encouraged German importers to look at Liberia as a potential source of logs.

Imports of sawn tropical wood from Malaysia have been in decline since 1997, but imports from Ghana continue to increase.

Germany's imports of temperate sawnwood have been increasing since 1997. There has also been a significant adjustment in sources of supply. Imports from Eastern Europe have been increasing, while imports from North America are in decline. This trend partly reflects the weakness of the euro in relation to the US dollar.

US plywood exports to Germany have collapsed due to high prices in the face of strong US domestic demand. Competitive pricing however has resulted in a significant increase in plywood imports from both Brazil and Indonesia.

Windows and doors are the main areas of sawnwood usage in Germany. With the production of 22 million to 26 million units of window frames per year, Germany is the largest market for windows in Europe. Tropical wood's market share of this market slumped between 1988 and 1994 from 25% to 10.9%. Reasons were high cost compared to uPVC and environmental activism. However the loss of market share for solid wood has been partly offset by increased use of wooden laminates. Indonesia has become an important supplier of this product to Germany.

German imports of other secondary processed and finished products from the tropics have also been increasing over recent years. Germany's imports of wooden furniture from developing countries increased from US\$233 million in 1992 to US\$331million in 1996, while imports of builders joinery and carpentry increased from US\$167 million to US\$225 million.

Germany's economy has been performing poorly over recent years, and this had hit hardwood demand. In the three quarters to end June this year, Germany's economy grew by only 0.3%. With the exception of Italy, these figures make Germany the most sluggish large economy in the world. Over 4 million German's are out of work. Germany's economic woes stem partly from over-regulation, high business taxes and costs of employment, which have reduced inward investment to a trickle. Many manufacturers are moving to lower-cost regions in Eastern Europe. Germany also has a huge national debt, fueled by high welfare spending.

A return to economic growth hinges on the success of reforms to liberalise the economy and reduce welfare spending. However, Chancellor Shroeders' efforts to introduce these reforms are being met with staunch political resistance.

The Netherlands

Hardwood trade seek to turn tide

The Netherlands has been Europe's largest importer of tropical sawn timber. However, despite a flourishing Dutch economy, tropical imports have declined rapidly over recent years. One reason has been severe environmental criticism. However, with the support of the Dutch gov-

ernment, the industry is responding with a range of policy initiatives.

In 1997, Dutch imports of tropical logs, sawnwood, veneer and plywood totalled US\$357.5 million, equivalent to about 15.3% of overall EU imports of US\$2.5 billion. Sawnwood was by far the biggest item, with a share of 59%, followed by plywood at 31%, logs 7% and veneer 3%. Between a quarter to a third of Dutch tropical timber import is re-exported to Germany, Belgium and other European countries. Holland is dependent on Malaysia for much of its tropical sawn hardwood. The Malaysians, with their large processing units, are well placed to supply Dutch kilning and size requirements. Dutch purchases are focused particularly on 3" by 5" of pin hole no defect grade which is painted for use in window frames.

Over recent years, Holland's consumption of sawn hardwood, notably tropical hardwood, has progressively declined. According to ITTO figures, in 1989, Holland imported around 876,000m3 of tropical sawnwood. However the latest data from SBH (the Dutch Institute for forestry and forest products), suggests that imports will amount to only 230,000m3 in 1999 and an equivalent volume in 1999.

The decline in tropical sawnwood imports has been, to some extent, offset by an increase in imports of secondary processed wood products. A recent OECD study indicates that Dutch imports of wooden furniture from developing countries increased from US\$76 million in 1992, to US\$169 million in 1996. Over the same period, Dutch imports of builders carpentry and joinery increased from US\$44 million to US\$102 million.

The environmental factor

The environmental factor has had a particularly significant impact on Dutch markets for sawn timber. The "Heart for Wood" Campaign in the Netherlands, initiated in 1992 by Friends of the Earth Netherlands and WWF, is one visible manifestation of environmental pressure. The campaign seeks to promote certification in all forest types and is actively supporting the Forest Stewardship Council. Its membership includes 252 municipalities (out of a total of 633 in Holland), and 10 state departments. About 75% of DIY chain stores in the Netherlands along with 139 housing corporations and 72 project developers are members.

Window manufacturing is an area where, before the emergence of the environmental movement, use of tropical timbers was predominant. According to the Dutch Association of Joinery Products Manufacturers, tropical timber is still technically the preferred material. However, the use of softwoods has been increasing. Now 30 to 35% of timber used in timber frames manufacture in Holland is softwood. The use of softwood has been boosted through the application of finger jointing and laminates. One positive factor has been the generally lower tendency in Holland than elsewhere in Europe to substitute tropical timber frames for PVC. The Association believes that the use of tropical timber could regain a portion of its market share through certification to guarantee sustainable forestry.

Action Plan Wood 2000

Another positive factor has been the Dutch government's declared policy to increase the use of timber as an environmentally friendly material in the building and construction sector. Dutch ministries are working with the forest sector on Action Plan Wood 2000, a strategy to raise the public's perceptions of the environmental benefits of wood use, to encourage innovation in the Dutch wood sector, and to improve efficiency in the Dutch wood chain. The Dutch government has also resisted attempts by environmentalists to seek exclusivity for the FSC label. Instead, it has lent its support to the Dutch industry's Keurhout initiative, which monitors and recognises forest management certificates issued under a variety of schemes and markets them under a single Hallmark.

The Keurhout scheme is proving increasingly popular in Holland. Keurhout report that 162 participating companies, including 42 timber trading companies (with 260 selling points) and 120 joinery manufacturers, are now committed to stocking products bearing the Hallmark. Supplies of Hallmarked wood are increasing rapidly. In April this year Keurhout accepted AssiDomän's Swedish FSC-certified forests under their scheme. Shortly after that, Stora's FSC-certified forests, together with the first stage of a certification pilot project in Finland received the Keurhout Hallmark.

Keurhout is also making significant progress on the tropical side. Although no tropical wood has

yet been fully endorsed by Keurhout, wood is being successfully marketed under a joint Dutch/ Malaysian pilot project to supply so-called "Declaration Wood". This wood derives from 3 states of Peninsular Malaysia where forest management has been independently assessed by SGS. Between 1997 and the first quarter of 1999, the Netherlands imported 52,000 m3 of Keurhout Declaration timber. According to Andre de Boer of the Dutch Timber Trade Federation, the market has been happy with the level of environmental assurance provided by the Keurhout Declaration, buying the wood eagerly and, in some instances, paying a premium. Mr de Boer believes that Keurhout has now "conquered an equal position in the market beside FSC". Expectations are that the whole of Peninsular Malaysia will receive full Keurhout endorsement during 2000. Furthermore, contacts have been made in the Congo Republic to certify a 1 million ha. concession.

Dutch economy

Economic conditions have been bouyant in Holland for some time. Expectations are that there will be a modest slow down in the economy this year, but that growth will remain significant. Economic growth was a flourishing 3.7% in 1998, and is expected to decline to around 2.8% in 1999 and 2.5% in 2000. Consumer spending has been an engine of growth in 1998 and 1999, boosted by the increase in wealth of households from rising house and stock prices. Dutch consumer spending is expected to weaken this year. On the other hand, exports are expected to be boosted by a recovery in the European economy and improving world trade. Despite relatively low interest rates in the euro zone, inflation is expected to remain modest at around 2% this year. Unemployment is declining, expected to reach only 3.8% next year, a major decline from a level of 8.7% in 1994.

The prospects for Holland's construction sector are mixed. The level of Dutch housing construction has been constant during the 1990s at between 80,000 to 90,000 new homes. New house building is expected to reach 86,000 homes this year, but decline to 85,000 next year, and 78,000 in 2001. Demand for housing remains strong, but construction will increasingly be limited by lack of land designated for new homes. Investment in non residential buildings, including new offices and shops, increased by 5.6% in 1998, but is expected to increase by only 2.1% this year, and decline by nearly 1% in 1999.

Ghana tests certification

Ghana is planning to field test it's forest certification standards later this year. The tests, beginning on 6 December, will be conducted in defined forest areas in the Western Ashanti and Brong Ahafo Regions. The tests will be carried out under the guidance of the Deputy Technical Director of the Ministry of Lands and Forestry. They will also be observed by representatives from UK certifying bodies to lend international credibility to the outcome of the test. Ghana's forest certification standard, "Quality Management of the Forests of Ghana: Forest Standards, Principles and Specifications", was drafted by a committee with representatives from a range of interest s including government, industry, traditional chiefs, and ENGOs.

Korea prospects good

According to the Pacific Rim Wood Market Report, Bill Brant, a high ranking official in the US Foreign Agricultural Service, provided a bullish account of wood market prospects in South Korea at the Second International Conference on Exploring Change in the New Asia in September. He noted that anti foreign sentiment had eased in Korea and that foreigners can now own property and 50% of a business. This factor, coupled with far reaching regulatory reform, particularly the lifting of foreign exchange regulations, are encouraging inward investment. Prospects in the construction sector are improving. Housing starts are expected to reach 400,000 this year and 500,000 in 2000, up from 306,000 in 1998. As Koreans are favourably disposed to wood housing, this should translate into higher wood consumption. Forecasts for the construction sector as a whole are also improving. According to the Korea Construction Association most recent outlook report, contracts in the sector are expected to be worth 54.2 trillion won (US\$44.9 billion) next year, up 19.1% from 45.51 trillion won estimated for this year. Particularly positive is

that a large part of this gain is expected to derive from the private sector, rather than from government infrastructure projects. Private sector contracts are expected to total 29.5 trillion won, up 38.1 % from this year.

New Liberian investment

According to government reports on Liberian radio, Oriental Timber, a Liberian and Malaysian joint venture, is planning to invest US\$50 million in developing the wood sector and infrastructure in in the Grand Bassa area of Liberia, around 100 km North East of Monrovia. The investment includes provision for the rehbilitation of the road between Buchanan and Greenville and renovation of the port of Buchanan. It would be the largest foreign investment scheme in Liberia since the elections of 1997. The company also intends to exploit 4 million acres of forests in the regions of Grand Bassa, Rivercess et Sinoe. As part of the deal, the company will be required to pay an annual tax of US\$1 million.

Clinton protects 40 million acres

President Bill Clinton has directed the U.S. Forest Service to develop regulations that will permanently protect some 40 million acres of roadless National Forest lands. Clinton's executive order would set aside 20% of the total forest land in America's national forests. About 18% of the 192 million acre national forest system is currently off limits to road building and development. Another 31% has never been logged or mined, but is not currently protected. The Clinton plan would ban road building in about two-thirds of that land. Clinton stressed that his initiative "should have almost no effect on timber supply. Only 5% of our country's timber comes from the national forests. Less than 5% of the national forests' timber is now being cut in roadless areas. We can easily adjust our federal timber program to replace 5% of 5%, but we can never replace what we might destroy if we don't protect these 40 million acres."

Electronic commerce

A new way of doing business?

Forest products companies have used electronic means to improve trading and streamline their operations for some time. The use of electronic data interchange to communicate internally and with customers and suppliers is already well established. Many companies also have websites to advertise their services and to obtain feedback from customers. The amount of market information available on the web is increasing daily. However recent developments suggest these electronic tools may only be the thin edge of the wedge. More profound changes in the environment for wood trading may be just around the corner. These changes may come about with the establishment of new websites with online facilities for wood trading.

Historically the wood industry has been highly fragmented by geography and product type, and hampered by high transportation costs and poor communication. Markets have been opaque, in the sense that accurate and comparable information on prices, supply sources and markets can be difficult to come by. Although it would be an overstatement to suggest that the internet will erradicate these "inefficiencies" in the wood trade, there is little doubt that the web has the potential to massively erode barriers of distance and ignorance.

One of the most profound changes is likely to come from growing use of websites providing real-time commercial trading online. A growing number of sites, many inevitably based in the US, are being developed which allow sellers to offer their stocks for sale and buyers to place orders. Examples of these sites include the International Timber Exchange, Hardwood.Net, and HardwoodSearch. In the latter, sawn hardwood buyers browse a marketplace developed by the Hardwood Market Review in Charlotte North Carolina, USA. After selecting the species and quality of

sawnwood desired, a buyer is given a list of supplies and suppliers available. The buyer may then submit a request which is simultaneously e-mailed and faxed to the supplier.

At present these sites are in their infancy. The vast majority of trade worldwide continues to be conducted through traditional channels of personal contact, telephone and fax. Most large forest products companies are watching from the sidelines, monitoring the development of electronic trading and looking for new opportunities. There are constraints to the development of e-business in the wood sector. For example, many companies will be concerned about security and confidentiality. There is still little understanding of the benefits of internet trading, while the availability of technically trained staff may be a problem for many.

However, the prospects for internet trading are good. The new websites offer a number of advantages including: reduced transaction charges and associated costs; faster rotation of stocks for the purchaser; quick response to changes in price, delivery or other conditions; easier comparison of product specifications and prices; greater access to vendors; and no restriction of trade to normal office hours.

Another development of potential importance to the wood trade is the use of the internet by shipping lines to communicate with their customers. On-line facilities are still the exception in the international shipping industry, but their benefits are obvious. As well as providing rate information and shipping schedules, shipping line web sites may offer interactive services such as consignment booking and tracking/tracing of consignments. These simplify the documentation process and provide greater peace of mind for customers. Furthermore, the more transparent the progress of a consignment, the greater the customer's ability to contemplate Just in Time delivery.

Tropical forestry African producers tackle certification

The principal European wood industry groups operating in tropical Africa have jointly announced a series of measures designed to provide credible assurances of good forestry practice to European consumers. The measures include the development of an environmental code of conduct and steps towards a forest certification scheme.

The measures are described in a communiqué issued by the Interafrican Forest Industries Association (IFIA) following a meeting in Milan in September. European members of IFIA have, since 1996, been supporting a Dutch-registered organization known as the European Foundation for the Preservation of African Forest Resources. The Foundation undertakes:

i) to work with ATIBT* to define a Model Forest Management Plan for application in the regions where Foundation members operate. Foundation members will co-operate with African governments to promote the plan.

ii) to work with IFIA, IUCN* and the CEFDHAC*, on the development of a professional code of conduct. Once approved, the code of conduct will be signed by the Foundation members, who will be bound to respect and to promote it throughout the profession. Foundation members and the IUCN will set up, over the coming months, a monitoring and evaluating committee to verify application of the code of conduct.

iii) to encourage international donors to continue to support the development of sustainability standards for natural tropical forest in tropical Africa. This should build on work undertaken by CIFOR* and ATO* to pilot test sustainability standards in five African countries.

iv) to encourage rapid establishment with all parties concerned, and make available to companies desiring it, a Pan-African Certification System which is adapted to regional specifications and internationally credible. Foundation Members will lend technical assistance to make the Certification operational.

Together Foundation members represent forestry concessions totalling 14 million hectares; wood production of 3.85 million m3; and log production of 2.35 million m3. The companies are of major economic importance to tropical African countries, having a turnover of US\$650 million; employing more than 20,000 people;
